The benefits of a Flange Weld Tester

Provides accurate, localised hydrostatic pressure testing of flange welds on pipeline installations, modifications and pipework repairs.

Specifically designed to test only the flange weld and not the whole pipeline by creating an intermediate chamber around the weld.

Only the chamber is tested, increasing safety and reducing the time required to undertake maintenance or modification work.

Size and configuration

Our Flange Weld Testers are assembled from component parts which are designed and manufactured in-house.

Our standard sizes range between 1/2" to 12" and are compatible with common pipe schedules and flange configurations up to Class 600.

Other units can be custom designed to suit the specific application for higher pressures and unusual pipe sizes.

Bespoke applications can also be reviewed, often at short notice.

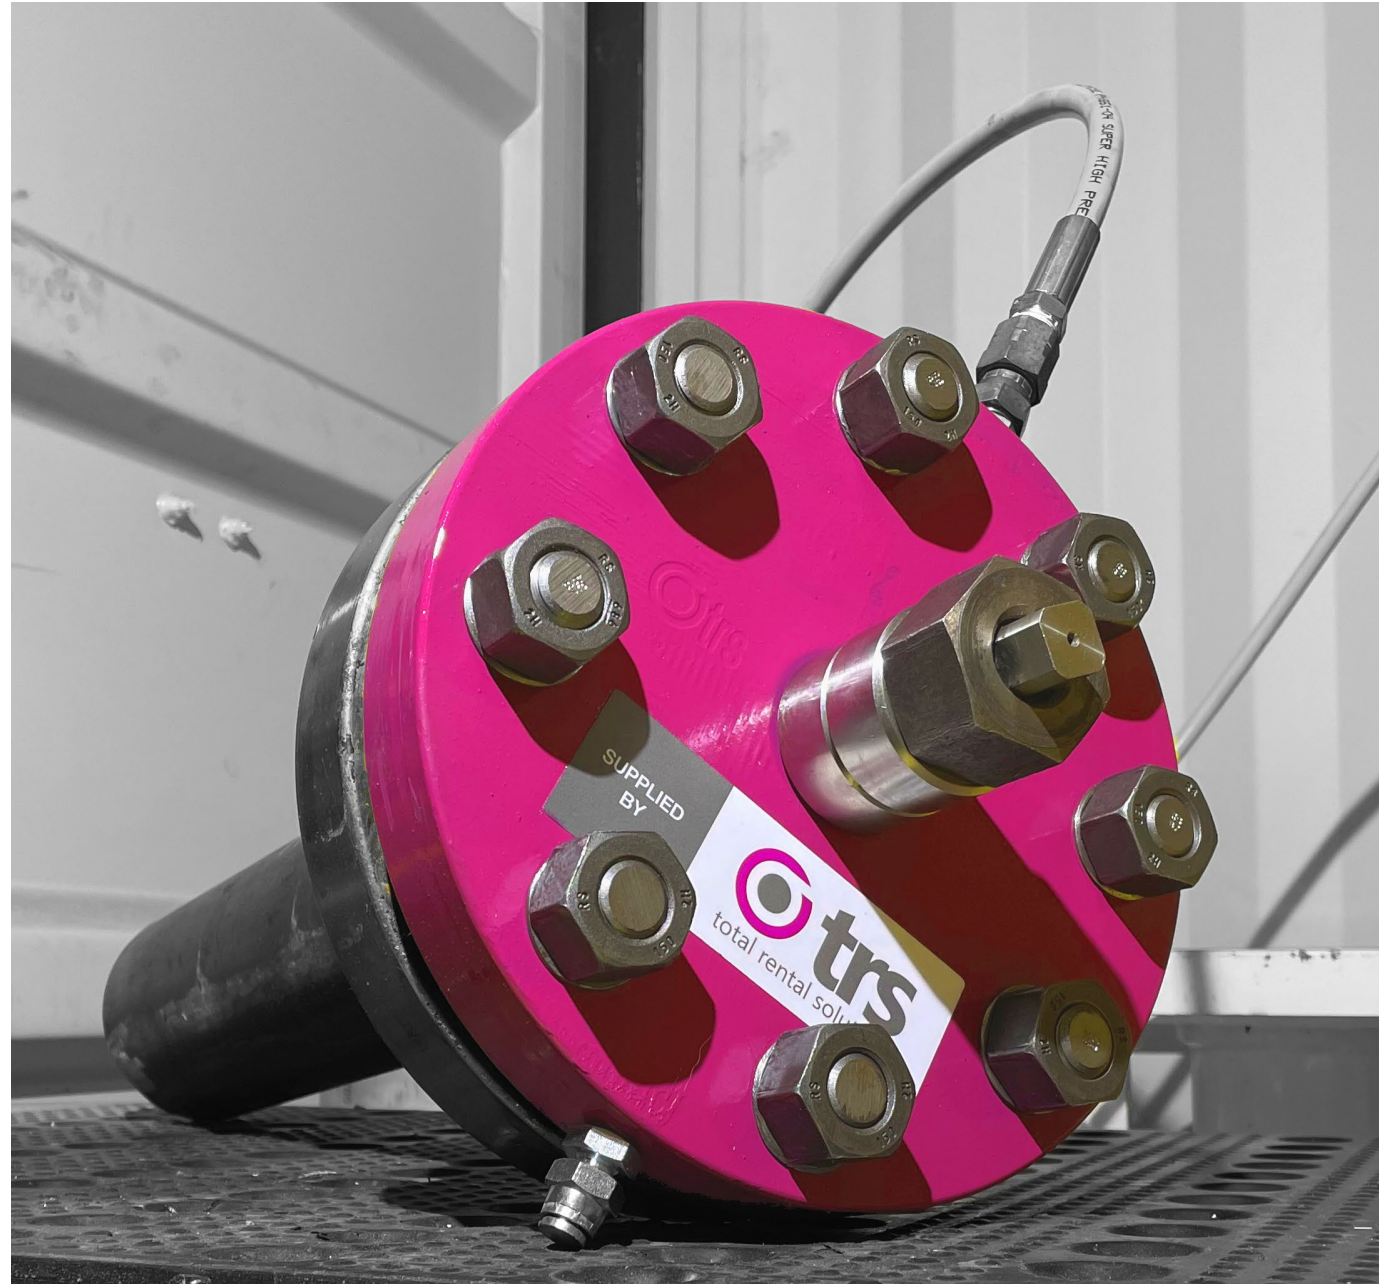

Testing and certification

Each of our flange weld testers is assembled, thoroughly inspected and tested prior to delivery.

A detailed validation certificate is issued with every unit, ensuring that it is safe and prepared for immediate use.

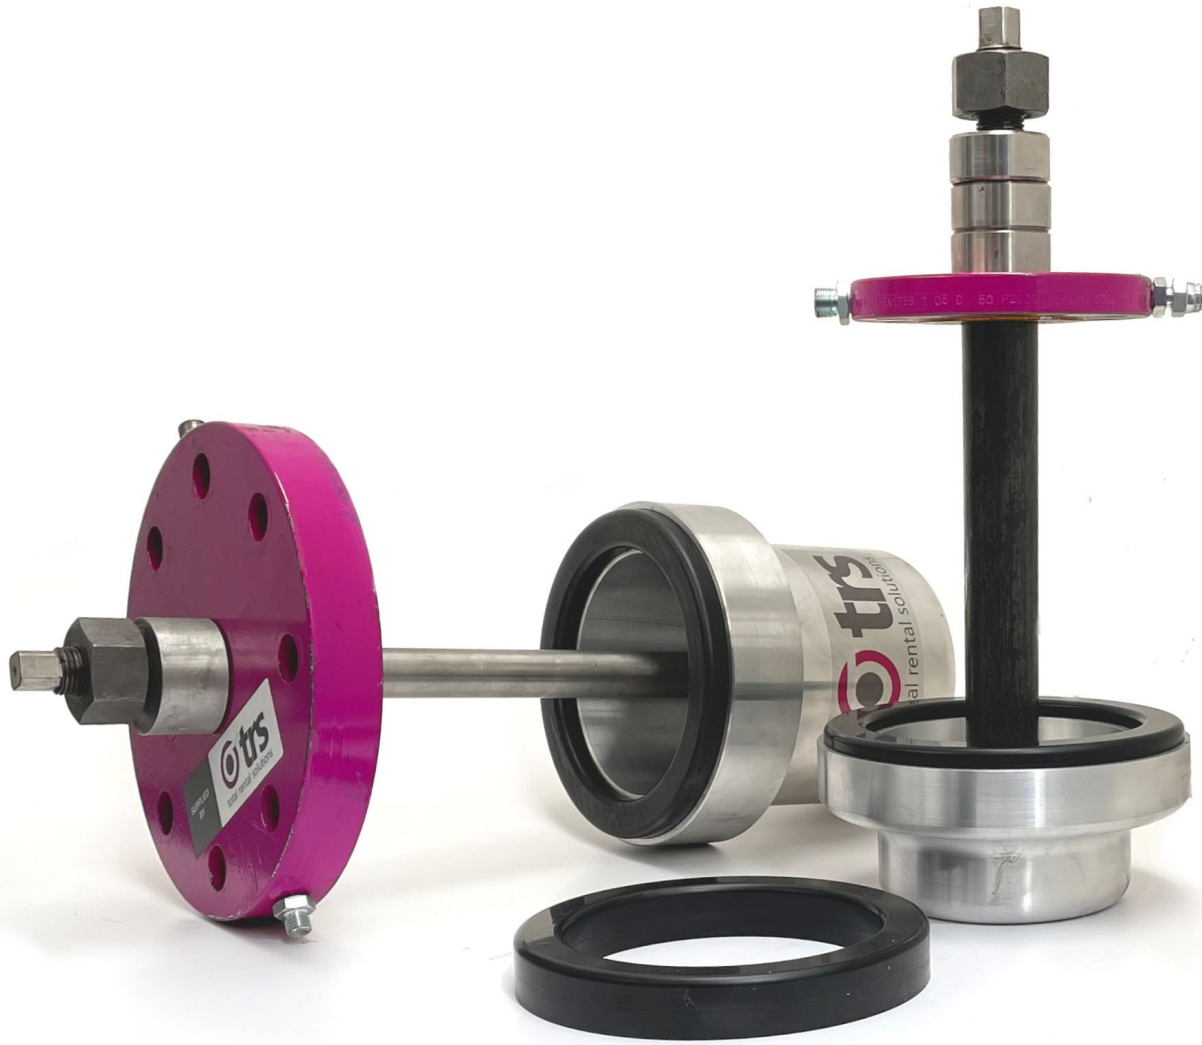

CERTIFIED
Safe to use

Bespoke Weld Testers

Bespoke solutions, such as tank nozzle testers and elbow flange weld testers can be provided upon request.

In most cases, units can be designed and manufactured from drawings provided by the client. All of our special units are tested in simulated conditions prior to being issued to site.

Hydrostatic Testing Equipment

Portable test rigs, suitable for pressure testing up to 500 bar

- manual, electric or pneumatic pumps
- portable manifolds
- pressure-rated hoses
- calibrated gauges
